```
import pandas as pd
pd.DataFrame({"Feed": ["horsebean", "linseed", "soybean", "sunflower", "meatmeal",
```

Out[1]: <style scoped> .dataframe tbody tr th:only-of-type { vertical-align: middle; } .dataframe tbody tr th { vertical-align: top; } .dataframe thead th { text-align: right; } </style> <thead> <th> </th> <th>Feed</th> <th>Min</th> <th>Max</th> <th>Mean</th> </thead> <tbody> <th>0</th> <th>1</th> <th>2</th> <th>3</th> <th>4</th> <th>5</th> </tbody> <tbody></tbody>

horsebean	108	227	160.20
linseed	141	309	218.75
soybean	158	329	246.43
sunflower	226	423	328.92
meatmeal	153	380	276.91
casein	216	404	323.58

Given that heavier chickens are better for business, it seems quite clear that sunflower seed is the best overall choice for chicken feed. Sunflower seed produced both a higher minimum weight and a higher maximum weight than all other choices, meaning the minimum weight of sunflower-fed chickens is the best option without worrying about the possibility of light chickens. However, casein feed produced a very close average without a massive decrease in minimum weight, meaning if casein is sufficiently less expensive, it might offset the lower average weight of the chickens. Horsebean, linseed, and soybean seem like clear losers here. While meatmeal produced the third highest average, the enormous drop-off in minimum weight compared to casein and sunflower makes meatmeal a much less attractive option.
